

For nearly 50 years aldicarb has provided peanut growers proven and reliable performance versus early season pest and the potential for increased profits.

AgLogic 15GG aldicarb can be applied as a single application at-plant at 7 lbs / acre or as a split application at-plant at 7 lbs / acre followed by an at-pegging at 10 lbs/ acre.

A multi-year data summary showed that aldicarb applied to peanuts at 7 lbs. per acre at-plant increased yields by an average of 539 lbs. per acre and an estimated additional profit of \$126 per acre.

Give your peanut crop a fighting chance for an early start with higher yields and superior quality.

AgLogicTM 15GG

- ◆ **Controls Early Season Pests & Nematodes**
- ◆ **Improves root and plant vigor**
- ◆ **Reduces the need for foliar insecticide sprays**
- ◆ **Can be applied at-planting or at-pegging**
- ◆ **Foundation for peanut IPM Program**
- ◆ **Often significantly increases yields**
- ◆ **Increases grade and reduces culls**

Aldicarb promotes healthy plant growth even in the absence of pest pressure.

In 2002, researchers found in a two year study of peanut plants grown pest free in growth chamber and greenhouse conditions that:

- Aldicarb provided more plant growth enhancement of peanut foliage, roots and pods when compared to phorate or an untreated control.
- Peanuts treated with aldicarb exhibited up to 54% increase top growth, 38% to 64% greater pod yield, up to 48% greater root growth at the 8 in depth than phorate or an untreated control.
- Peanuts treated with aldicarb were able to withstand the effects of drought stress better than phorate or untreated control.

*Growth Enhancement Effects of Aldicarb on Peanuts - Poster presented at the American Peanut Research and Education Society Meeting - July 18, 2002 (Rosemond and Ingram)

What was true 20 years ago is true today.

THRIPS

- ◆ Provides up to six weeks of control with a single at-planting application
- ◆ Eliminates or minimizes need for additional early season foliar applications

APHIDS, LEAFHOPPERS & SPIDER MITES

- ◆ Controls and or suppresses initial infestations which often vector damaging diseases throughout the season
- ◆ Minimizes flare-ups later in the season

NEMATODES

- ◆ Helps protect against root-knot, lesion, sting and ring which can account for 20-90 percent yield reduction
- ◆ Minimizes secondary diseases associated with nematode infestations such as pod rot and root diseases such as cylindrocladium black rot

EARLY PLANT DEVELOPMENT

- ◆ Stimulates root establishment and early plant vigor
- ◆ Easy on beneficials
- ◆ Promotes faster canopy development to assist in weed control programs
- ◆ Consistently increases yield & nut quality
